1.2.2 Firm Targets × Same Applicant Demographic

Takeaway: When a firm states it targets a demographic, its individual evaluators rate applicants of that group *lower*, not higher — more strongly among engineers than HR. This mirrors the substitution pattern documented in Section 1.2.3: where institutional DEI effort is high, individual evaluators somehow seem to ease off from the institutional push.

Firm Targets × Same Applicant Demographic (s5_policy_diversity)

F = Female, H = Hispanic, B = Black. "Targets F or H" ⇒ `firm_targets_female = 1` OR `firm_targets_hispanic = 1`; "Targets F, H, or B" additionally includes `firm_targets_black = 1` (robustness check; note that Black applicants are not in the study). URM = {WF, AF, HM, HF}.

1.2.3 Triple Interaction: Personal Priority × Firm Attention

Takeaway: **Hypothesis: Substitution vs. Backlash Effect.**

- **Substitution**: When a firm already prioritizes DEI, individuals who *also* personally prioritize DEI reduce (rather than amplify) the URM premium — they treat the firm's push as sufficient and ease off. *Expect a negative sign on the triple interaction term.*
- **Backlash**: When a firm prioritizes DEI, individuals who do *not* personally prioritize DEI react by rating URM applicants lower. *Expect a positive sign on the triple interaction term.*

The negative triple interactions for HR (with both race-DEI and gender-DEI firm-attention proxies) support the **substitution** hypothesis, not backlash.

Outcome Var: Assigned Overall Score (Z). URM-Tech Binary Cut.

	Firm Race-DEI Attn		**Firm Gender-DEI Attn**	
	HR	Eng	HR	Eng
	(1)	(2)	(3)	(4)

	(0.042)	(0.036)	(0.054)	(0.031)
Resume FE	✓	✓	✓	✓
Respondent FE	✓	✓	✓	✓
Position FE	✓	✓	✓	✓
Observations	1,026	1,098	1,008	1,080
Adjusted R^2	0.37300	0.74422	0.36822	0.74760

`div_priority_z` = z-score of (8 − `s4_goals_5`), the revealed priority of "Diversity and Representation" in the respondent's ranking of seven hiring goals. `firm_attention_race_z` / `firm_attention_gender_z` = z-scores of `s5_view_dei_race_f` / `s5_view_dei_gender_f`, the respondent's perception of their firm's current DEI attention level. Standard errors clustered by respondent. Sample: non-blind arm.

Reading the HR Overall regression at $\pm 1\sigma$ of each covariate (for Hispanic Male applicants, vs White Male), the four quadrants give the most direct picture of the substitution mechanism:

Table 1: Predicted Hispanic Male premium (vs. White Male) on HR Overall rating, at quadrants of (personal diversity priority × firm race-DEI attention).

	Firm Race-DEI Attention	
	Low Firm Race Attn	High Firm Race Attn
Low personal priority (-1σ)	+0.19	-0.11
High personal priority ($+1\sigma$)	+0.74	-0.15

The largest HM premium ($+0.74\sigma$) sits in the (high personal priority, low firm attention) cell — the "individual compensates for firm inattention" case. At firms already emphasizing race-DEI (right column), HM premia collapse regardless of personal priority. The backlash quadrant (low personal priority, high firm attention) is modestly negative, not extreme.

Implication: Neither stated DEI attitudes nor observable firm DEI behaviors, taken singly, explain variation in demographic premia. However, the combination of strong personal diversity priority and a firm that does not visibly act on it is associated with a substantially larger Hispanic-Male premium among HR evaluators — a pattern consistent with individual-level substitution for perceived firm inattention, rather than backlash against firm over-emphasis.
