8A_Report_Preferences

1 Preferences (All Dimensions)

Takeaway: On average, HR shows little demographic preference, while Engineers display a stronger preference for non-White groups over White Males.

2 Heterogeneity in Preferences (By Respondent Demographics)

Takeaway: HR does not display preference based on demographic concordance. Engineers assign a slight premium (0.56–0.86% of a SD) to non-concordant groups, driven primarily by White Male Engineers — the majority group among Engineers — whose positive preference favors non-White demographic groups.

Takeaway (2): In the U.S. IT setting, the traditional concordance bias (homophily) and animus (discrimination against minorities) story can be rejected.

2.1 By Concordant Race (using detailed Asian categorization)

3.2 (2-way Interaction Models) By Whether the Firm Targets the Same Applicant Demographic

Takeaway: When a firm states it targets a demographic, its individual evaluators rate applicants of that group *lower*, not higher — more strongly among engineers than among HR. This mirrors the substitution pattern documented in Section 3.3: where institutional DEI effort is high, individual evaluators appear to ease off from the institutional push.

Firm Targets × Same Applicant Demographic (s5_policy_diversity)

	Panel A: HR	Panel B: Engineer

Observations	1,188	1,188	1,332	1,332
Adjusted R^2	0.37901	0.37901	0.74114	0.74076

F = Female, H = Hispanic, B = Black. "Targets F or H" ⇒ `firm_targets_female = 1` OR `firm_targets_hispanic = 1`; "Targets F, H, or B" additionally includes `firm_targets_black = 1` (robustness check; note that Black applicants are not in the study). URM = {WF, AF, HM, HF}.

3.3 (Triple Interaction Models) By Respondent's Priority for DEI × Firm Attention on DEI

Takeaway: The negative triple interactions for HR (with both race-DEI and gender-DEI firm-attention proxies) support the **substitution** hypothesis, not backlash.

Hypothesis: **Substitution vs. Backlash Effect.**

- **Substitution**: When a firm already prioritizes DEI, individuals who *also* personally prioritize DEI reduce (rather than amplify) the URM premium — they treat the firm's push as sufficient and ease off. *Expect a negative sign on the triple interaction term.*
- **Backlash**: When a firm prioritizes DEI, individuals who do *not* personally prioritize DEI react by rating URM applicants lower. *Expect a positive sign on the triple interaction term.*

Outcome Var: Assigned Overall Score (Z). URM-Tech Binary Cut.

	Firm Race-DEI Attn		**Firm Gender-DEI Attn**	
	HR	Eng	HR	Eng
	(1)	(2)	(3)	(4)

Position FE	✓	✓	✓	✓
Respondents (used)	57	61	56	60
Dropped (NA proxy)	9	13	10	14
Observations	1,026	1,098	1,008	1,080
Adjusted R^2	0.37300	0.74422	0.36822	0.74760

`div_priority_z` = z-score of (8 − `s4_goals_5`), the revealed priority of "Diversity and Representation" in the respondent's ranking of seven hiring goals. `firm_attention_race_z` / `firm_attention_gender_z` = z-scores of `s5_view_dei_race_f` / `s5_view_dei_gender_f`, the respondent's perception of their firm's current DEI attention level. Standard errors clustered by respondent. Sample: non-blind arm; respondents with a missing firm-DEI-attention response are dropped by `feols` (see the `Respondents (used)''` and`Dropped (NA proxy)''` rows).

Note on interpretation: On the full non-blind Engineer sample (all 74 respondents), a two-way model `sc_overall_z ~ urm_tech | responseid + resume_index + r_do_bythree` reports a statistically significant $\hat{\beta}_{\text{URM}} = +0.060$ ($p = .041$). It attenuates to statistically insignificant $\hat{\beta} \approx +0.040$ in the triple-model subsample for two reasons: (a) ≈ 18% of Engineers are dropped due to answering "Do Not Know'' in the question that elicits how much firm pays attentions to DEI, and (b) these dropped respondents happen to rate URM applicants more favorably than respondents who did characterize their firm's DEI posture.
