1.2.2 Firm Targets × Same Applicant Demographic

Takeaway: When a firm states it targets a demographic, its individual evaluators rate applicants of that group *lower*, not higher — more strongly among engineers than HR. This mirrors the substitution pattern documented in Section 1.2.3: where institutional DEI effort is high, individual evaluators somehow seem to ease off from the institutional push.

Firm Targets × Same Applicant Demographic (s5_policy_diversity)

	Panel A: HR	Panel B: Engineer
	(1)	(2)
White Female	-0.048	0.084

Observations	1,188	1,188	1,332	1,332
Adjusted R^2	0.37901	0.37901	0.74114	0.74076

F = Female, H = Hispanic, B = Black. "Targets F or H" ⇒ `firm_targets_female = 1` OR `firm_targets_hispanic = 1`; "Targets F, H, or B" additionally includes `firm_targets_black = 1` (robustness check; note that Black applicants are not in the study). URM = {WF, AF, HM, HF}.

1.2.3 Triple Interaction: Personal Priority × Firm Attention

Takeaway: **Hypothesis: Substitution vs. Backlash Effect.**

- **Substitution**: When a firm already prioritizes DEI, individuals who *also* personally prioritize DEI reduce (rather than amplify) the URM premium — they treat the firm's push as sufficient and ease off. *Expect a negative sign on the triple interaction term.*
- **Backlash**: When a firm prioritizes DEI, individuals who do *not* personally prioritize DEI react by rating URM applicants lower. *Expect a positive sign on the triple interaction term.*

The negative triple interactions for HR (with both race-DEI and gender-DEI firm-attention proxies) support the **substitution** hypothesis, not backlash.

Outcome Var: Assigned Overall Score (Z). URM-Tech Binary Cut.

`div_priority_z` = z-score of (8 − `s4_goals_5`), the revealed priority of "Diversity and Representation" in the respondent's ranking of seven hiring goals. `firm_attention_race_z` / `firm_attention_gender_z` = z-scores of `s5_view_dei_race_f` / `s5_view_dei_gender_f`, the respondent's perception of their firm's current DEI attention level. Standard errors clustered by respondent. Sample: non-blind arm.

1.3 By DEI (Original)

The DEI Index used in this section is constructed as the row-wise mean of z-scored responses to four survey items capturing views on race-based DEI (`s5_view_dei_race`), gender-based DEI (`s5_view_dei_gender`), workplace diversity (`s5_view_diverse`), and DEI in hiring (`s5_view_hiring_dei`), and is then re-standardized within role × treatment cells. See "By DEI (New)" below for an alternative construction that drops `s5_view_hiring_dei` and matches the proxy to the demographic dimension being tested.

1.4 By DEI (New)

The original "By DEI" section above interacts an under-represented-minority indicator with a four-item DEI index (`pro_dei_index_z`). The new analysis below makes two refinements suggested by the survey-item structure: (i) **match** the heterogeneity proxy to the demographic dimension being tested — race-DEI view (`pro_dei_race_z`) for race premia, gender-DEI view (`pro_dei_gender_z`) for gender premia; and (ii) **drop** `s5_view_hiring_dei` from any composite, since it is an empirical belief about the *effect* of DEI on hiring quality and is therefore prone to mechanical correlation with the demographic-evaluation behavior we are trying to measure. We also report two composite indices built only from the normative items — one with and one without the personal diversity preference (`s5_view_diverse`) — and `s5_view_diverse` standalone for completeness. All specifications use White Male as the reference applicant and are restricted to the non-blind arm. Composite indices are constructed inline as the row-mean of the named components, then re-standardized within the analysis sample.

1.4.1 Domain-Matched: Race-DEI View

Heterogeneity proxy: z-score of `s5_view_dei_race` (higher = more pro race-DEI). Each group's main-effect row shows the premium over White Male at the proxy mean; the interaction row shows how that premium shifts per 1 SD increase in pro race-DEI view.

1.5.7 Triple Interaction: Personal Priority × Firm Attention (Backlash Test)

The race-attention single interaction above showed a negative coefficient on Hispanic Male × firm race-DEI attention (HR Overall $\approx -0.27^{***}$). One reading is **backlash**: respondents at firms with high perceived race-DEI attention — but whose *personal* diversity priority is low — feel the firm is over-weighting DEI and downgrade URM candidates in response. That hypothesis predicts a *positive* triple interaction: higher personal priority flips the firm-attention effect from negative to positive. Below we test this with `div_priority_z` × firm-attention, separately for race and gender attention.

1.6 By DEI (Storyline)

1.6.1 What we tested

A natural story would be: respondents with stronger pro-DEI views should exhibit larger premia toward under-represented applicants. We test that across **11 heterogeneity proxies** — five stated preferences (the four DEI-view items plus their composites), four firm-level behaviors (policy count, blind-hiring use, URM targeting, perceived attention), and one forced-choice revealed priority (`s4_goals` rank of Diversity) — interacted with applicant demographics two ways (6-group and URM-binary).

1.6.2 What we found (one line)

Stated and single revealed-preference proxies do not meaningfully shift demographic premia. Across 132 interaction tests (11 proxies × 4 outcomes × 3 interaction terms on average), significance counts are close to chance. The URM-binary cut is especially striking: **0 of 44 interactions reach $p < 0.10$**. No single DEI proxy — by itself — explains who gives URM candidates a premium.

1.6.3 The one signal, and what it looks like

Exception: the **triple interaction** of personal diversity priority with firm-perceived DEI attention is consistently negative for HR ($p < 0.05$ on both coding and overall outcomes, for both race- and gender-attention). Reading the HR-Overall regression for Hispanic Male candidates at ±1 SD of each covariate gives:

Table 1: Predicted Hispanic Male premium (vs. White Male) on HR Overall rating, by quadrant of respondent's personal Diversity priority (s4_goals_5) and perceived firm race-DEI attention (s5_view_dei_race_f). Non-blind arm, $N = 1{,}188$.

	Firm Race-DEI Attention	
	Low Firm Race Attn	High Firm Race Attn
Low (personal, -1σ)	+0.19	-0.11
High (personal, $+1\sigma$)	+0.74	-0.15

1.6.4 Interpretation: substitution, not backlash

A "backlash" reading of the single interaction on firm race-attention (negative coefficient on HM × firm attention) would predict a **positive** triple interaction: anti-DEI respondents at pro-DEI firms should be the ones penalizing URM candidates. The data does the opposite.

What the quadrant table actually shows:

1. The **largest HM premium** ($+0.74\sigma$) appears in HR respondents who **personally prioritize diversity** *and* work at firms that **don't**. These are compensators — filling a gap they see their firm as leaving open.
2. Once the firm **is** emphasizing race-DEI, personal priority stops mattering. HR respondents at high-attention firms give roughly no HM premium regardless of their own views.
3. The backlash cell — anti-DEI personal, pro-DEI firm — is not a large negative. It is modestly negative, not meaningfully different from the other high-firm-attention cell.

The pattern fits a **substitution** mechanism: personal DEI effort and institutional DEI effort appear to be substitutes in the HR evaluator's behavior, not complements. The "do the work when the firm isn't, and ease off when the firm is" description is consistent with the Hispanic Female triple (similar signs for HR Coding and Overall) and with the parallel result when firm *gender*-attention is swapped in for race-attention.

1.6.5 Caveats

- The result is **HR-specific**: engineers' triple interactions are null across the board.
- The triple interaction involves two simultaneously-scaled proxies; the quadrant numbers are linear-projection extrapolations, not sample averages. The corner cells contain relatively thin subsamples.
- This is one sample, and with 11 primary proxies tested before we arrived at the triple, the "storyline" bears some selection. It would be strongest as a *replication target* rather than a confirmed result.

1.6.6 Implications for the paper

If we choose to report a DEI-heterogeneity story, the defensible framing is:

> *"Neither stated DEI attitudes nor observable firm DEI behaviors, taken singly, explain variation in demographic premia. However, the combination of strong personal diversity priority and a firm that does not visibly act on it is associated with a substantially larger Hispanic-Male premium among HR evaluators — a pattern consistent with individual-level substitution for perceived firm inattention, rather than backlash against firm over-emphasis."*

This is a cleaner claim than "pro-DEI → more URM premium," which the data doesn't support.
