

Stage-by-Stage Impact of Blind Hiring

1 Treatment Effect on Evaluations

1.1 On All Dimensions (Z)

Takeaway: Blinding demographic information *reshuffles* candidates' relative evaluations across stages.

- **HR:** Hispanic Male candidates' Overall scores fall by **11.5%** of a SD under blinding.
- **Eng:** White Male scores rise by **8.5%** of a SD, Hispanic Female scores fall by **6.9%** of a SD.
- **Caveat:** Hiring is often an ordinal ranking problem — one candidate's gain corresponds to another's lost opportunity — so the absence of statistical significance on a given row does not mean the corresponding group is unaffected by blinding.

Panel A: HR

	Coding (Z)	Fit (Z)	Stay (Z)	Overall (Z)	Advance (0/1)
White Male	0.038 (0.056)	0.073 (0.057)	0.072 (0.059)	0.037 (0.057)	−0.006 (0.050)
White Female	0.020 (0.046)	0.010 (0.053)	0.022 (0.065)	0.013 (0.051)	0.003 (0.049)
Asian Male	0.032 (0.052)	0.029 (0.061)	−0.050 (0.061)	0.015 (0.059)	−0.022 (0.049)
Asian Female	0.020 (0.052)	−0.011 (0.056)	0.028 (0.062)	−0.023 (0.048)	−0.019 (0.052)
Hispanic Male	−0.142*** (0.050)	−0.056 (0.053)	−0.084 (0.062)	−0.115** (0.048)	−0.047 (0.049)
Hispanic Female	0.040 (0.058)	−0.049 (0.067)	0.013 (0.074)	0.087* (0.052)	−0.001 (0.056)
Resume (Content) FE	✓	✓	✓	✓	✓
Display Position FE	✓	✓	✓	✓	✓
Respondent FE	×	×	×	×	×
Respondent Characteristics	✓	✓	✓	✓	✓
Observations	2466	2430	2394	2466	2466
R ²	0.398	0.315	0.196	0.423	0.229
Adj. R ²	0.383	0.297	0.176	0.408	0.210

* p < 0.1, ** p < 0.05, *** p < 0.01

Standard errors clustered by respondent.

Note on Interpreting Coefficients: The underlying regression uses Blind resumes as the reference category, so raw coefficients capture (nonblind − blind) or the effect of being blinded for each demographic on standardized overall evaluation scores. We then multiply by −1 to report (blind − nonblind), aligning the sign convention with the standard “effect of blinding” framing. Positive coefficient ⇒ blinding raises the score for that demographic.

Panel B: Engineer

	Coding (Z)	Fit (Z)	Stay (Z)	Overall (Z)
White Male	0.072** (0.029)	0.040 (0.041)	0.045 (0.049)	0.085*** (0.028)
White Female	0.028 (0.031)	0.046 (0.045)	0.023 (0.053)	0.023 (0.036)
Asian Male	−0.071** (0.028)	0.083* (0.046)	0.002 (0.050)	−0.018 (0.028)
Asian Female	0.003 (0.029)	−0.099** (0.042)	−0.053 (0.048)	−0.029 (0.029)
Hispanic Male	0.009 (0.027)	0.023 (0.037)	0.042 (0.054)	−0.003 (0.030)

* p < 0.1, ** p < 0.05, *** p < 0.01

1.2 Does Blinding Lead to More Accurate Coding Evaluations?

Takeaway: Evaluators do extract signal about candidates’ actual coding ability — Engineers much more strongly than HR, consistent with Engineers seeing the code while HR sees only the resume. Blinding, however, does *not* meaningfully change this signal-extraction ability in either role: the `true_coding_z` $\times$ `blind` interaction is small, negative, and statistically insignificant for both HR and Engineers. If blinding — which in our experiment amounts to removing random, uninformative demographic noise — improved signal-extraction ability, we would expect a positive and statistically significant interaction term. In short, blinding *reshuffles* who receives high scores (Section 1.1) but does not change *how well* those scores track actual coding skill.

Specification:

Hiring Evaluation Score (Z) $\sim$ True Coding Ability (Z) $\times$ 1[Blind arm] | Respondent FE + Display Position FE.

- $H_0: \beta = 0$ — the evaluator extracts *no signal* from true coding ability.
- $H_0: \beta = 1$ — the evaluator is *perfectly calibrated*: a 1 SD rise in true ability produces exactly a 1 SD rise in the rating, with no shrinkage.

	HR	Engineer
$\hat{\beta}_{\text{nonblind}}$ (slope, nonblind arm)	0.377 (0.029)	0.886 (0.012)
$\hat{\beta}_{\text{blind}}$ (slope, blind arm)	0.357 (0.023)	0.856 (0.015)
Observations	2,466	2,772
R^2	0.142	0.759
Adj. R^2	0.085	0.743
Resume (Content) FE	×	×
Display Position FE	✓	✓
Respondent FE	✓	✓
Respondent Characteristics	×	×

Cluster-robust standard errors (by respondent) shown in parentheses next to each $\hat{\beta}$. Stars on p-values: * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$. *Note:* Both arm-specific slopes come from a single pooled interacted regression per role, `sc_coding_z ~ true_coding_z * i(treat, ref = 'nonblind') | responseid + r_do`; $\hat{\beta}_{\text{nonblind}}$ is read off the main coefficient, and $\hat{\beta}_{\text{blind}}$ is computed as (main + interaction) with SE derived via the standard linear-combination formula using the estimated variance-covariance matrix. The “Resume (Content) FE” row is marked as not included because `overall_score` is a resume-level property (one lab score per resume), so a resume-content FE would absorb the RHS and leave the main slope unidentified. “Respondent Characteristics” is marked as not included because respondent-level variables (age, gender, race, education, income) are all perfectly collinear with the respondent FE and therefore absorbed by it.

1.3 Heterogeneity in Signal Extraction by Candidate Quality

Hypothesis: Evaluators may pay more attention to “appealing” candidates, so the slope of evaluator rating on true coding ability ($\hat{\beta}$) might be steeper for top-tier applicants. We split the resume sample by (a) lab coding ability (top half vs bottom half on `test_case`) and (b) GPA tier (`gpa_tier3`: Low / Mid / Top), then re-run the §1.2 specification within each subsample.

Each panel shows the slope $\hat{\beta}$ of the evaluator’s rating on true coding ability, fit on the labeled subsample with the same specification as §1.2 (`sc_coding_z ~ true_coding_z * i(treat, ref = 'nonblind') | responseid + r_do`). Vertical dashed lines mark $\hat{\beta} = 0$ (no signal) and $\hat{\beta} = 1$ (perfect calibration). Horizontal bars are 95% CIs based on cluster-robust standard errors (by respondent).

2 Treatment Effect: Heterogeneity by DEI / Diversity Preferences

2.1 By Individual DEI / Diversity Preferences

- **Index A** — equal-weight average (1/5 each) of five z-scored items: the four stated DEI views plus the revealed-priority ranking of “Diversity and Representation” from the seven-goals question.
- **Index B** — first principal component of the same five items.

	Per Race-Gender			
	Panel A: HR		Panel B: Engineer	
	Index A (1)	Index B (2)	Index A (3)	Index B (4)
White Male	0.040 (0.056)	0.040 (0.056)	0.086*** (0.028)	0.085*** (0.028)
White Female	0.014 (0.051)	0.014 (0.051)	0.023 (0.035)	0.023 (0.036)
Asian Male	0.016 (0.060)	0.016 (0.060)	-0.017 (0.028)	-0.017 (0.028)
Asian Female	-0.023 (0.048)	-0.023 (0.048)	-0.030 (0.029)	-0.030 (0.029)

Hispanic $\times$ DEI $\times$ Firm DEI Attn	0.170***	-0.005
	(0.060)	(0.025)

Top panel: per-race-gender triple (only the 6 triple terms shown). Bottom panel: URM-axis triple (full 12 coefficients), where Male (non-hispanic) = WM+AM, Female (non-hispanic) = WF+AF, Hispanic = HM+HF. The URM-cut block is omitted: it is implied by the axis block (URM = Female (non-hispanic) + Hispanic; Non-URM = Male (non-hispanic)). Both blocks share identical specification: Resume (Content) FE $\checkmark$, Display Position FE $\checkmark$, Respondent FE $\times$, Respondent Characteristics $\checkmark$.

Standard errors clustered by respondent.

Note: Firm DEI Attn proxy is `firm_dei_attention_z` (within-cell z-score of the equal-weight average of `firm_attention_race_z` and `firm_attention_gender_z`).

Positive coefficient $\Rightarrow$ effect of blinding raises the score for that group.

3 Treatment Effect: Heterogeneity by Demographics

Takeaway: We reject the traditional own-group preference (equivalently, out-group discrimination) story.

- **Findings.** HR: null. Engineers: blinding raises concordant applicants by 6.9% of a SD, lowers nonconcordant by 0.9% of a SD.
- **Interpretation.** Signs run *opposite* to own-group preference. Engineers rate concordant applicants *higher* (nonconcordant *lower*) when blinded.

3.1 By Concordant Race (matched on detailed Asian Ethnicity)

	Panel A: HR (N = 137)					Panel B: Engineer (N = 154)			
	Coding	Fit	Stay	Overall	Advance	Coding	Fit	Stay	Overall
Concordant Applicant	−0.011 (0.039)	−0.001 (0.040)	−0.041 (0.047)	−0.020 (0.042)	−0.042 (0.046)	0.032 (0.021)	0.046 (0.031)	0.025 (0.039)	0.045* (0.023)
Nonconcordant Applicant	0.004 (0.014)	0.000 (0.014)	0.014 (0.017)	0.007 (0.015)	−0.007 (0.044)	−0.010 (0.006)	−0.014 (0.009)	−0.008 (0.012)	−0.014* (0.007)
Resume (Content) FE	✓	✓	✓	✓	✓	✓	✓	✓	✓
Display Position FE	✓	✓	✓	✓	✓	✓	✓	✓	✓
Respondent FE	×	×	×	×	×	×	×	×	×
Respondent Characteristics	✓	✓	✓	✓	✓	✓	✓	✓	✓

R ²	0.396	0.314	0.195	0.421	0.229	0.787	0.569	0.344	0.742
Adj. R ²	0.382	0.297	0.176	0.407	0.211	0.783	0.560	0.331	0.737

* p < 0.1, ** p < 0.05, *** p < 0.01

Standard errors clustered by respondent.

Note: Concordance is defined at the detailed race level: Asian respondents are matched at the sub-ethnicity level (Chinese / Indian). Respondents whose race is not represented in the applicant pool (e.g., Black, Other; Korean / Japanese / other-Asian whose sub-ethnicity is not Chinese or Indian) are treated as always-discordant in nonblind.

Coefficients are flipped so positive $\Rightarrow$ blinding raises the score for that concordance group relative to the nonblind outcome.

3.2 By Concordant Gender

	Panel A: HR (N = 137)					Panel B: Engineer (N = 154)			
	Coding	Fit	Stay	Overall	Advance	Coding	Fit	Stay	Overall

Observations	2466	2430	2394	2466	2466	2772	2772	2736	2772
R ²	0.396	0.314	0.195	0.421	0.229	0.787	0.569	0.345	0.742
Adj. R ²	0.382	0.298	0.176	0.407	0.211	0.783	0.560	0.331	0.737

* p < 0.1, ** p < 0.05, *** p < 0.01

Standard errors clustered by respondent.

Note: Respondents whose gender is not represented in the applicant pool (e.g., Non-binary, Other) are treated as always-discordant in nonblind, since the applicant names are exclusively Male or Female.

Coefficients are flipped so positive $\Rightarrow$ blinding raises the score for that concordance group relative to the nonblind outcome.

3.3 By Concordant Race and Gender

	Panel A: HR (N = 137)					Panel B: Engineer (N = 154)			
	Coding	Fit	Stay	Overall	Advance	Coding	Fit	Stay	Overall
Concordant Applicant	-0.030 (0.058)	0.008 (0.065)	0.018 (0.078)	-0.057 (0.063)	-0.022 (0.058)	0.004 (0.032)	0.003 (0.044)	-0.011 (0.050)	0.040 (0.028)
Nonconcordant Applicant	0.005 (0.010)	-0.001 (0.012)	-0.003 (0.014)	0.010 (0.011)	-0.015 (0.043)	-0.001 (0.007)	-0.001 (0.009)	0.002 (0.010)	-0.008 (0.006)

* p < 0.1, ** p < 0.05, *** p < 0.01

Standard errors clustered by respondent.

Note: Concordance is defined as race-gender match at the broad level (Asian respondents are matched at the broad Asian level rather than by detailed sub-ethnicity). Respondents whose race or gender is not represented in the applicant pool (e.g., Black, Other; Non-binary, Other-gender) are treated as always-discordant in nonblind.

Coefficients are flipped so positive $\Rightarrow$ blinding raises the score for that concordance group relative to the nonblind outcome.

3.4 By Concordant Race and Gender (matched on detailed Asian Ethnicity)

	Panel A: HR (N = 137)					Panel B: Engineer (N = 154)			
	Coding	Fit	Stay	Overall	Advance	Coding	Fit	Stay	Overall
Concordant Applicant	-0.030 (0.064)	0.020 (0.067)	0.019 (0.087)	-0.076 (0.068)	-0.029 (0.059)	0.037 (0.029)	0.047 (0.047)	0.049 (0.060)	0.069** (0.032)
Nonconcordant Applicant	0.004 (0.009)	-0.003 (0.010)	-0.003 (0.012)	0.011 (0.010)	-0.014 (0.043)	-0.005 (0.004)	-0.007 (0.006)	-0.007 (0.008)	-0.009** (0.004)

Observations	2466	2430	2394	2466	2466	2772	2772	2736	2772
R ²	0.396	0.314	0.195	0.421	0.229	0.787	0.569	0.344	0.742
Adj. R ²	0.382	0.297	0.176	0.408	0.211	0.783	0.560	0.331	0.737

* p < 0.1, ** p < 0.05, *** p < 0.01

Standard errors clustered by respondent.

Note: Concordance is defined at the detailed race-gender level: applicants are Chinese, Indian, White, or Hispanic (by gender). Respondents whose detailed race-gender is not represented in the applicant pool (e.g., Korean / Japanese / other-Asian sub-ethnicities; Black, Other-race; Non-binary, Other-gender) are treated as always-discordant in nonblind.

Coefficients are flipped so positive $\Rightarrow$ blinding raises the score for that concordance group relative to the nonblind outcome.

4 Treatment Effect on Productivity of Hired

Does Blind Hiring Select Better Coders?

Effect of blinding on actual coding quality of selected candidates. Standardized relative to nonblind group at each k.

Positive = blind hiring selects candidates with higher actual coding scores.

Significance: * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$
